

AiR Games

Problem:

When creating Augmented-Reality games, there is simply no low-cost, easy to use, and powerful solution.

Goal:

Our challenge for this project was to create a powerful and free package on which to build an incredible Augmented-Reality experience.

Augmented Reality

transforms the world around you. With the help of a computer vision system. Augmented-Reality recognizes, analyzes, and tracks select images in physical reality. This analysis yields spatial locations of the tracked image in 3d space, so that virtual content can then be rendered onto a real world video background in real time.

What We Accomplished:

Our software package allows developers to create immersive Augmented Reality applications simply and powerfully. By leveraging the sophisticated and open-source GameKit game-engine, and integrating it with Qualcomm's Augmented-Reality SDK we have built a free way for developers to make games, product displays, data visualizations and anything else that can be imagined.
