

## Customer

**Problem**

Customers need to find and research infrared products that match their needs.

**Solution**

An application that allows users to easily search for the products they need.

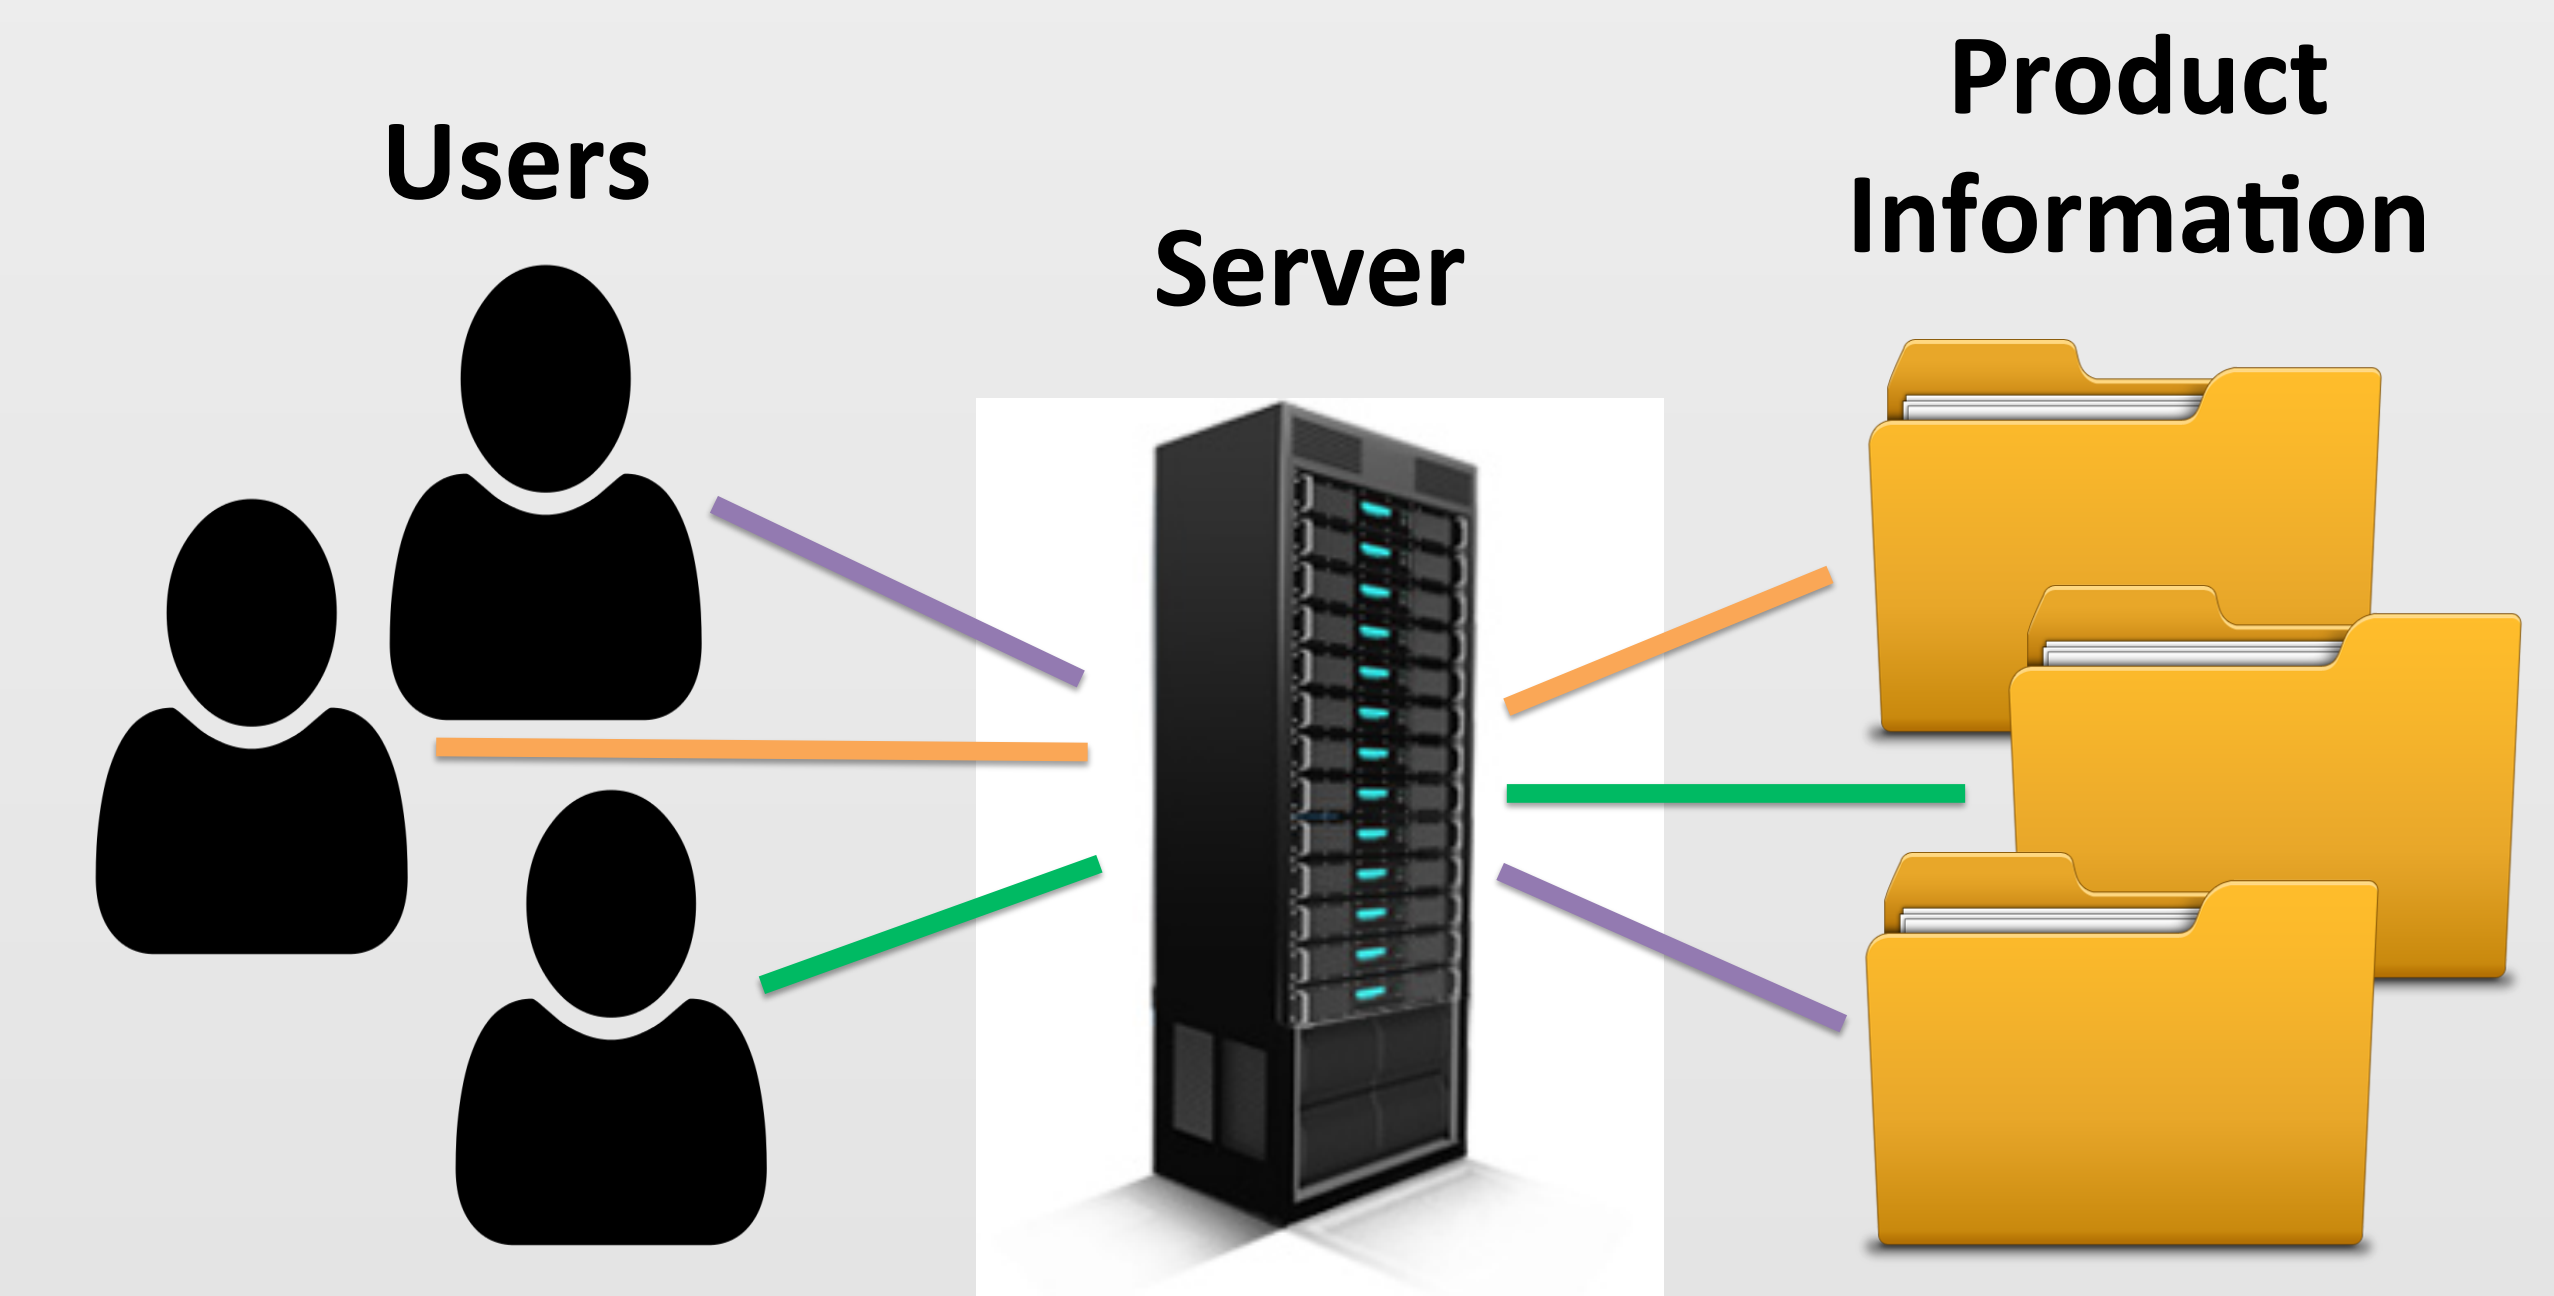

## Business

**Problem**

Raytheon wants their product information available to customers.

**Solution**

A database that stores each Raytheon product and its information.

The server is responsible for keeping track of each request it receives and sending back the appropriate product info.

The users can search by wavelength or by a set of parameters

< Home Advanced Search

Size (μm)

Mass (g)

Power (mW)

Wavelength (μm)

Resolution Width (Pixels)

Resolution Height (Pixels)

Pixel Pitch (μm)

Full Frame Rate (Hz)

Heat Management >

Capture Method >

Sensor Type >

Detector Material >

Submit

Carrier 10:05 PM

< Advanced Search Clear Search

SB373 SWIR

PS-360E-1

PS-360E-3

PS-360E-2

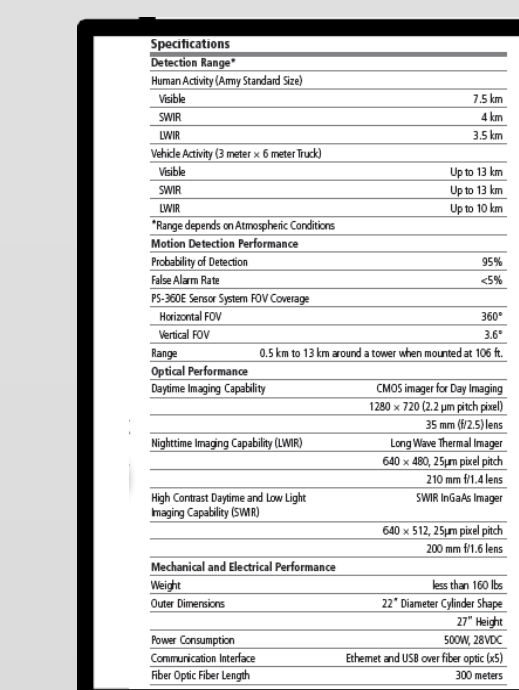

The results will be displayed for the user to see.

### Database

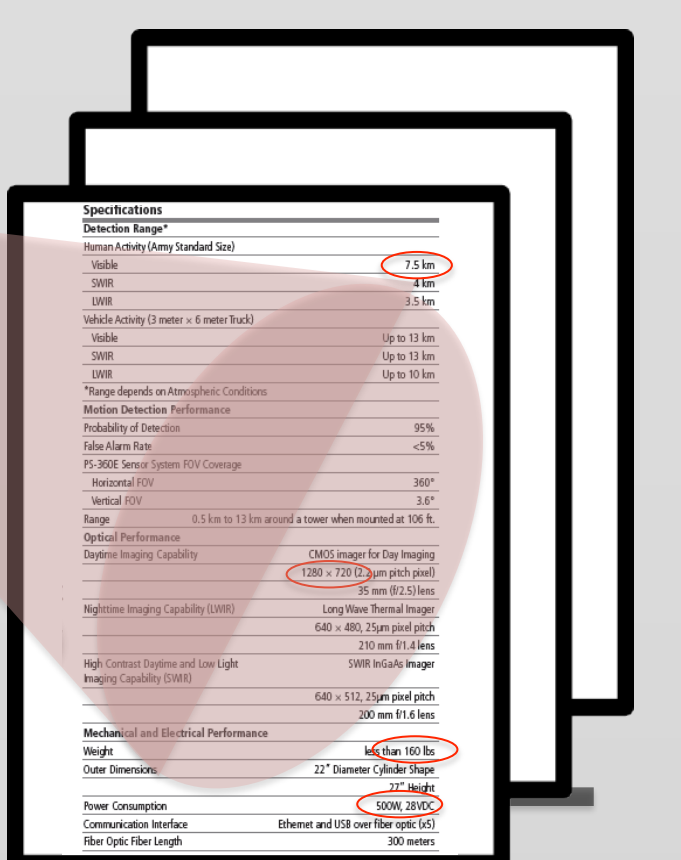

The web client uses the PDF extractor to determine the key values of a product (size, power, wavelength, etc.). The web client then stores the file in the database using these values as labels. When a user submits a search these labels are used to check if a file matches what the user wants.
